Global Changes of the Past, July 1988

Temperature Change From 1961-1990 Average

Temperature Change From 1961-1990 Average

Lying With Statistics, Global Warming Edition

Temperature Plateaus — 1912-2012

(IPCC 2013, Fig. SPM.1a)

Each of the last three decades has been successively warmer at the Earth's surface than any preceding decade since 1850.

In the Northern Hemisphere, 1983–2012 was *likely* the warmest 30-year period of the last 1400 years (*medium confidence*).

Why the IPCC ?

Established by WMO and UNEP in 1988

to provide **policy-makers**
with an **objective source of**
information about

- causes of climate change,
- potential environmental and socio-economic impacts,
- possible response options.

WMO=World Meteorological Organization

UNEP= United Nations Environment
Programme

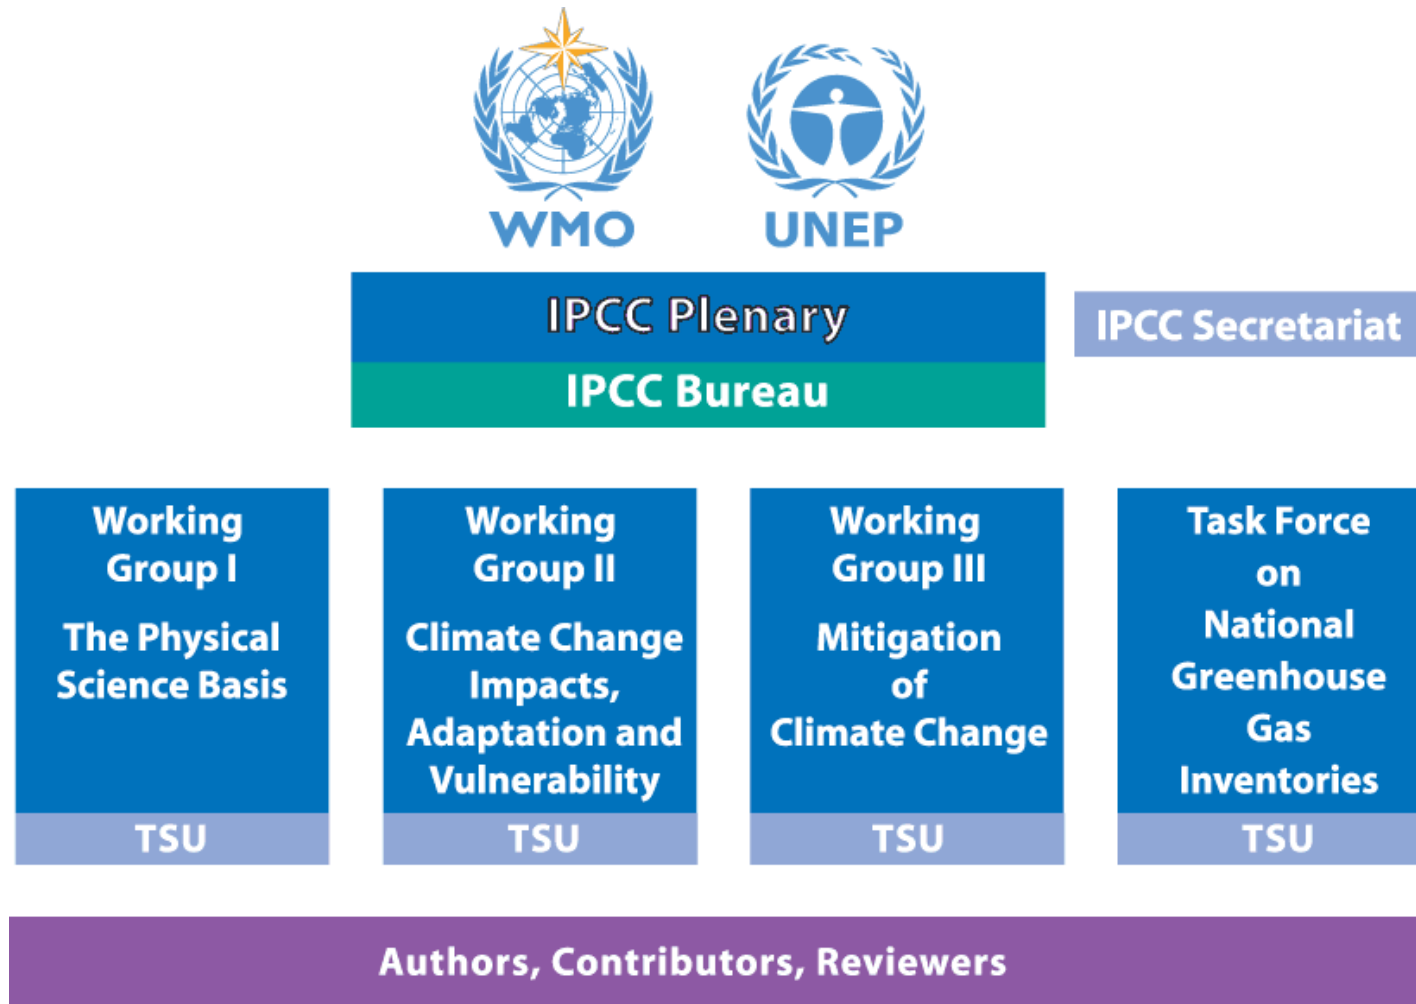

What is the IPCC (GIEC in French) ?

- **IPCC : Intergovernmental Panel on Climate Change**
- **Created by World Meteorological Organisation (WMO) & United Nations Environment Programme (UNEP) in 1988**
- **Mandate : assess the science of climate change, impacts and adaptation, mitigation options**
- **Publishes consensus reports (1990, 1996, 2001, 2007) (Cambridge University Press)**
Advises Climate Change Convention
- **Nobel Peace prize (2007)**
- **Web : <http://www.ipcc.ch>**

IPCC Reports are
policy-relevant,
NOT
policy-prescriptive

Structure of the Intergovernmental Panel on Climate Change

IPCC writing cycle (4 years, 831 Lead authors)

- Plenary decides table of content of reports
- Bureau appoints world-class scientists as authors, based on publication record
- Authors assess all scientific literature
- *Draft* – Expert *review* (+ Review editors)
- *Draft 2 (+ Draft 1 Summary for Policy Makers (SPM))* – Combined expert/government *review*
- *Draft 3 (+ Draft 2 SPM)* – Government *review* of SPM
- Approval Plenary (interaction authors – governments) – *SPM and full report*
- ***NB: the scientists have the last word!***

Completed IPCC Reports

4 Assessment Reports (1990, 1995, 2001, 2007, [2013-14])

1992 Supplementary Report and 1994 Special Report

8 Special Reports (1997, 1999, 2000, 2005, 2011)

Guidelines for National GHG Inventories, Good Practice Guidance (1995-2006)

6 Technical Papers (1996-2008)

The IPCC assessments have influenced global action on an unprecedented scale

- 1. The First Assessment Report (FAR, 1990) had a major impact in defining the content of the **UNFCCC****
- 2. The Second Assessment Report (SAR, 1996) was largely influential in defining the provisions of the **Kyoto Protocol****
- 3. The Third Assessment Report (TAR, 2001) focused attention on the **impacts** of climate change and the need for **adaptation****
- 4. The Fourth Assessment Report (AR4, 2007) informed the decision on the ultimate objective (**2°C**) and is creating a strong basis for a **post Kyoto Protocol** agreement (IPCC received **Nobel Peace Prize** in 2007)**
- 5. The Fifth Assessment Report (AR5, 2013-14) will inform the **review of the 2°C objective**, and be the context for preparing the **Paris 2015 agreement****

The Fifth Assessment Report (AR5)

- **WG I:** The Physical Science Basis
end September 2013
- **WG II:** Impacts, Adaptation and
Vulnerability
end March 2014
- **WG III:** Mitigation of Climate Change
mid April 2014
- **AR5 Synthesis Report (SYR)**
October 2014

2010: 259 Scientists Selected

2009: WGI Outline Approved

Observed change in surface temperature 1901–2012

Warming of the climate system is unequivocal, [...]

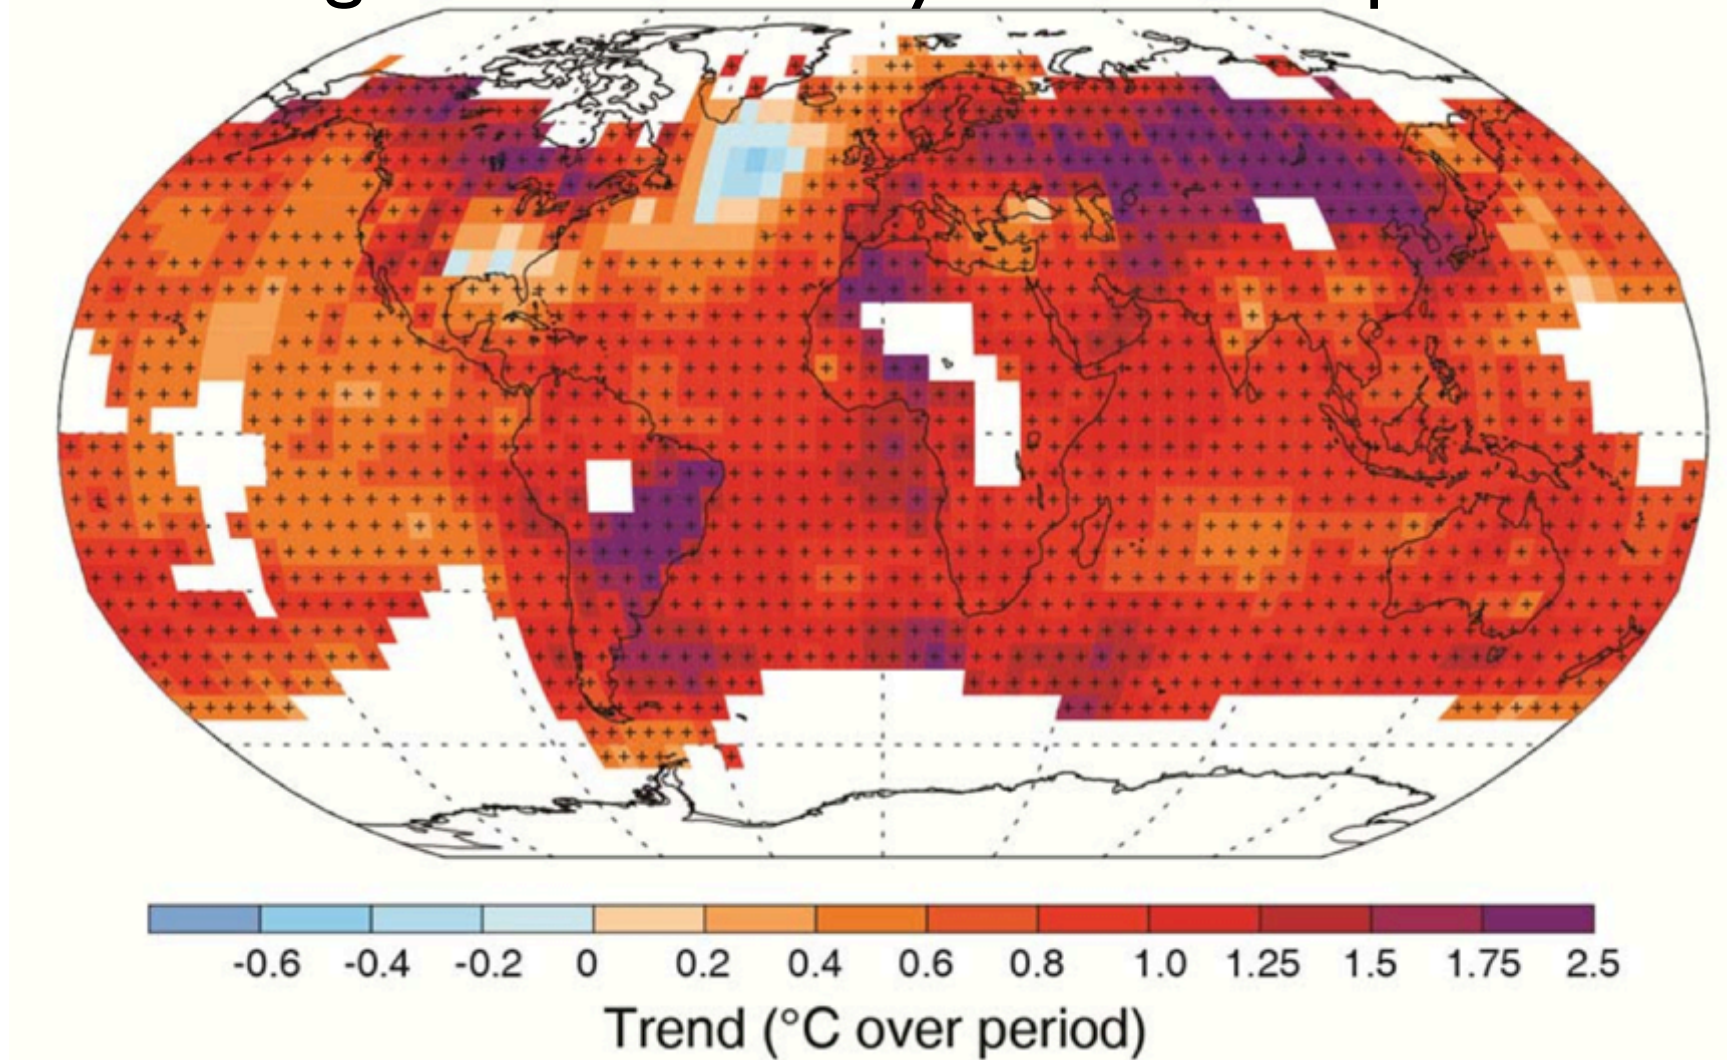

Human influence on the climate system is clear.

Limiting climate change will require substantial and sustained reductions of greenhouse gas emissions.

Change in average surface temperature 1901-2012

Warming in the climate system is unequivocal

Atmospheric CO₂ over the last 800000 years

A Progression of Understanding: Greater and Greater Certainty in Attribution

AR1 (1990):
“unequivocal detection
not likely for a decade”

AR2 (1995): “balance
of evidence suggests
discernible human
influence”

AR3 (2001): “most of
the warming of the
past 50 years is **likely**
(odds 2 out of 3) due
to human activities”

AR4 (2007): “most of
the warming is **very
likely** (odds 9 out of 10)
due to greenhouse
gases”

AR5 (2013) «It is **extremely likely**
(odds 95 out of 100) that human influence
has been the dominant cause... »

Fig. SPM.10

Cumulative emissions of CO₂ largely determine global mean surface warming by the late 21st century and beyond.

© IPCC 2013

Fig. SPM.10

Limiting climate change will require substantial and sustained reductions of greenhouse gas emissions.

© IPCC 2013

Limiting warming to *likely* less than 2°C since 1861-1880 requires cumulative CO₂ emissions to stay below 1000 GtC. Until 2011, over 50% of this amount has been emitted.

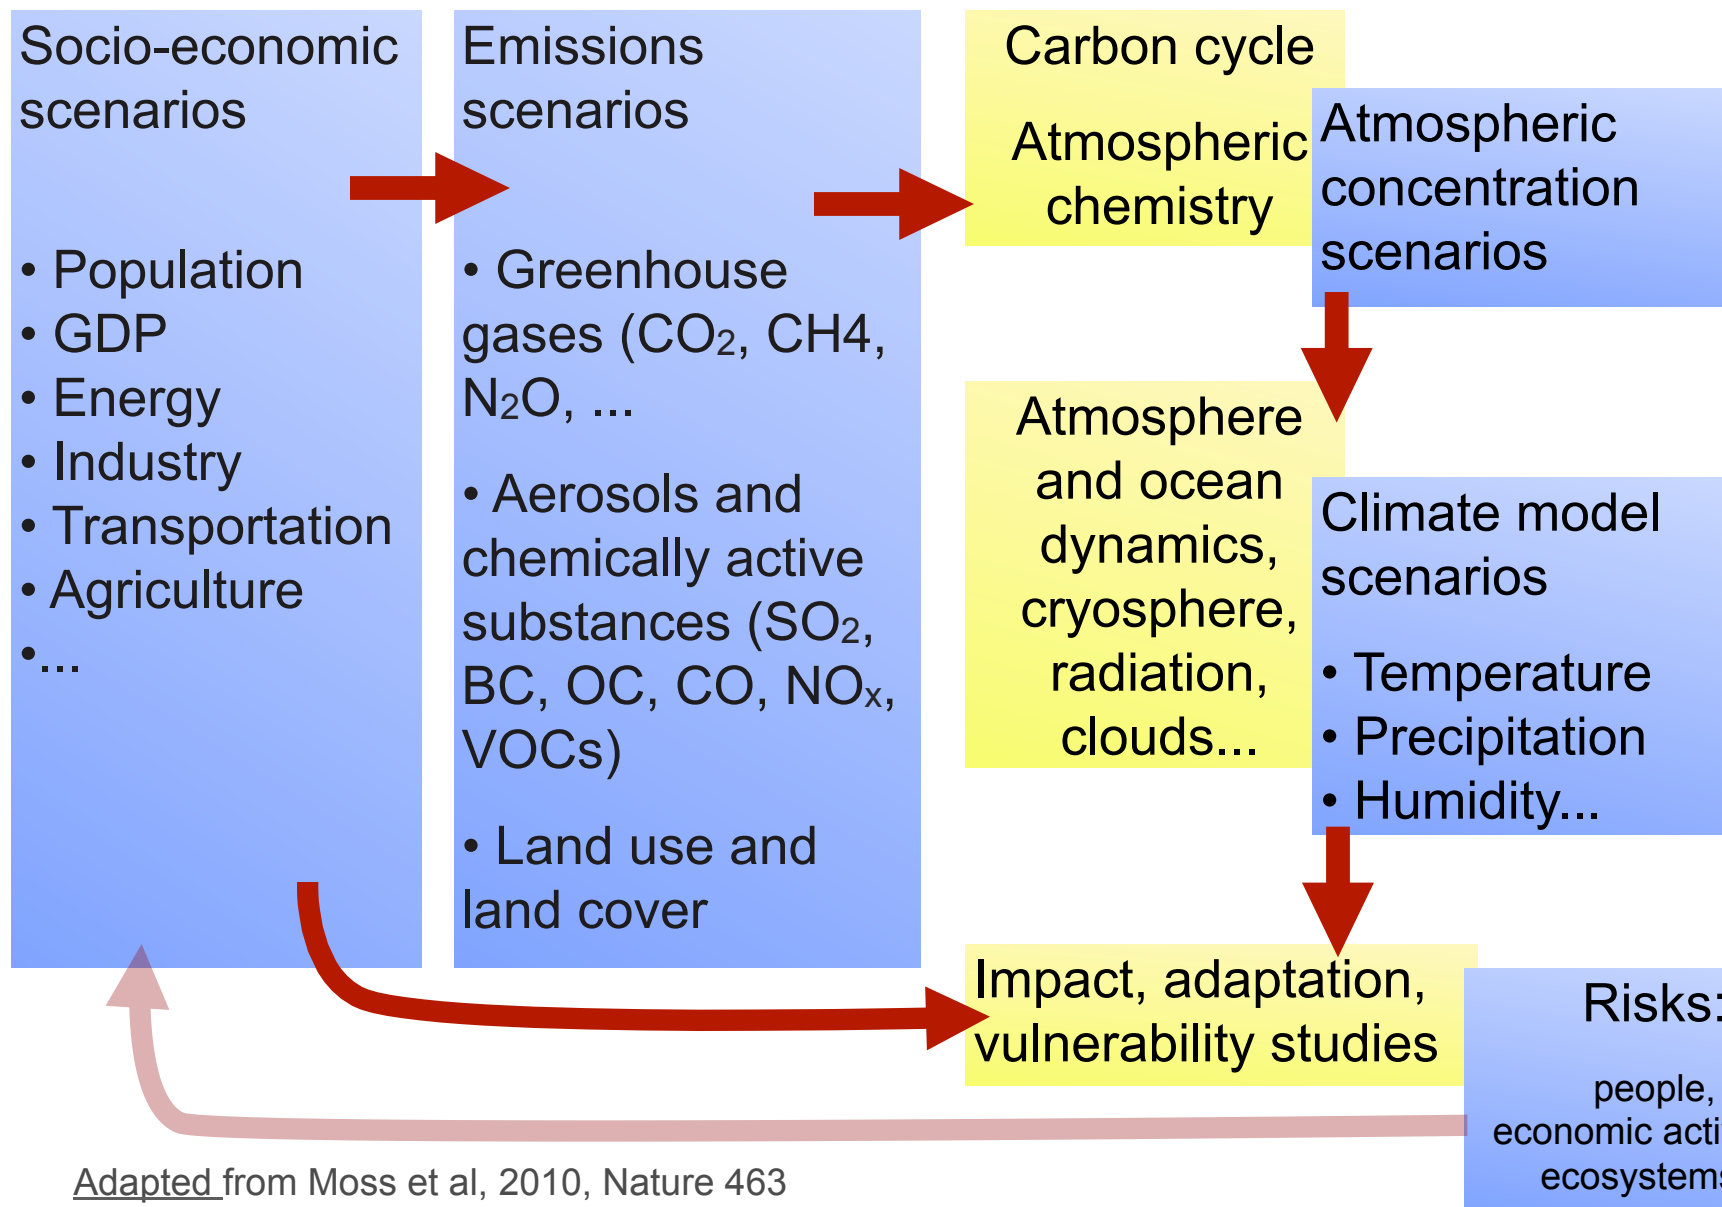

Accounting for other forcings, the upper amount of cumulative CO₂ emissions is 800 GtC; over 60% have been emitted by 2011.

Scenario definition (IPCC WGI AR5 Glossary, 2013)

Scenario: A **plausible** description of how the future **may** develop based on a **coherent and internally consistent set of assumptions about key driving forces** (e.g., rate of technological change, prices) **and relationships**. Note that scenarios are **neither predictions nor forecasts**, but are **useful to provide a view of the implications** of developments and actions.

See also Climate scenario, Emission scenario, Representative Concentration Pathways and SRES scenarios.

Scenarios: socio-economic, emissions, concentrations, climate change

Scénarios @ IPCC : where we come from

- IPCC 1990 : SA90, baseline & mitigation policy
- IPCC 1992 : IS92, no climate policy

- IPCC 2000 : Special Report on Emission Scenarios (SRES), no climate policy, but detailed analysis of drivers, socio-economic storylines...

→ Assessment reports : TAR, AR4, still part of AR5

- Others outside IPCC (ex. WRE (1996) stabilization)

Special Report on Emissions Scenarios

N. Nakicenovic & R. Swart
(Eds), 2000

Remark: ***No mitigation policies
implied in any SRES scenario***

SRES Scenarios: Extensively used in CC Research and Assessments since 2000

Climate projections without mitigation

Stabilization in AR4: From equilibrium global temperature to concentrations to emissions (without using SRES)

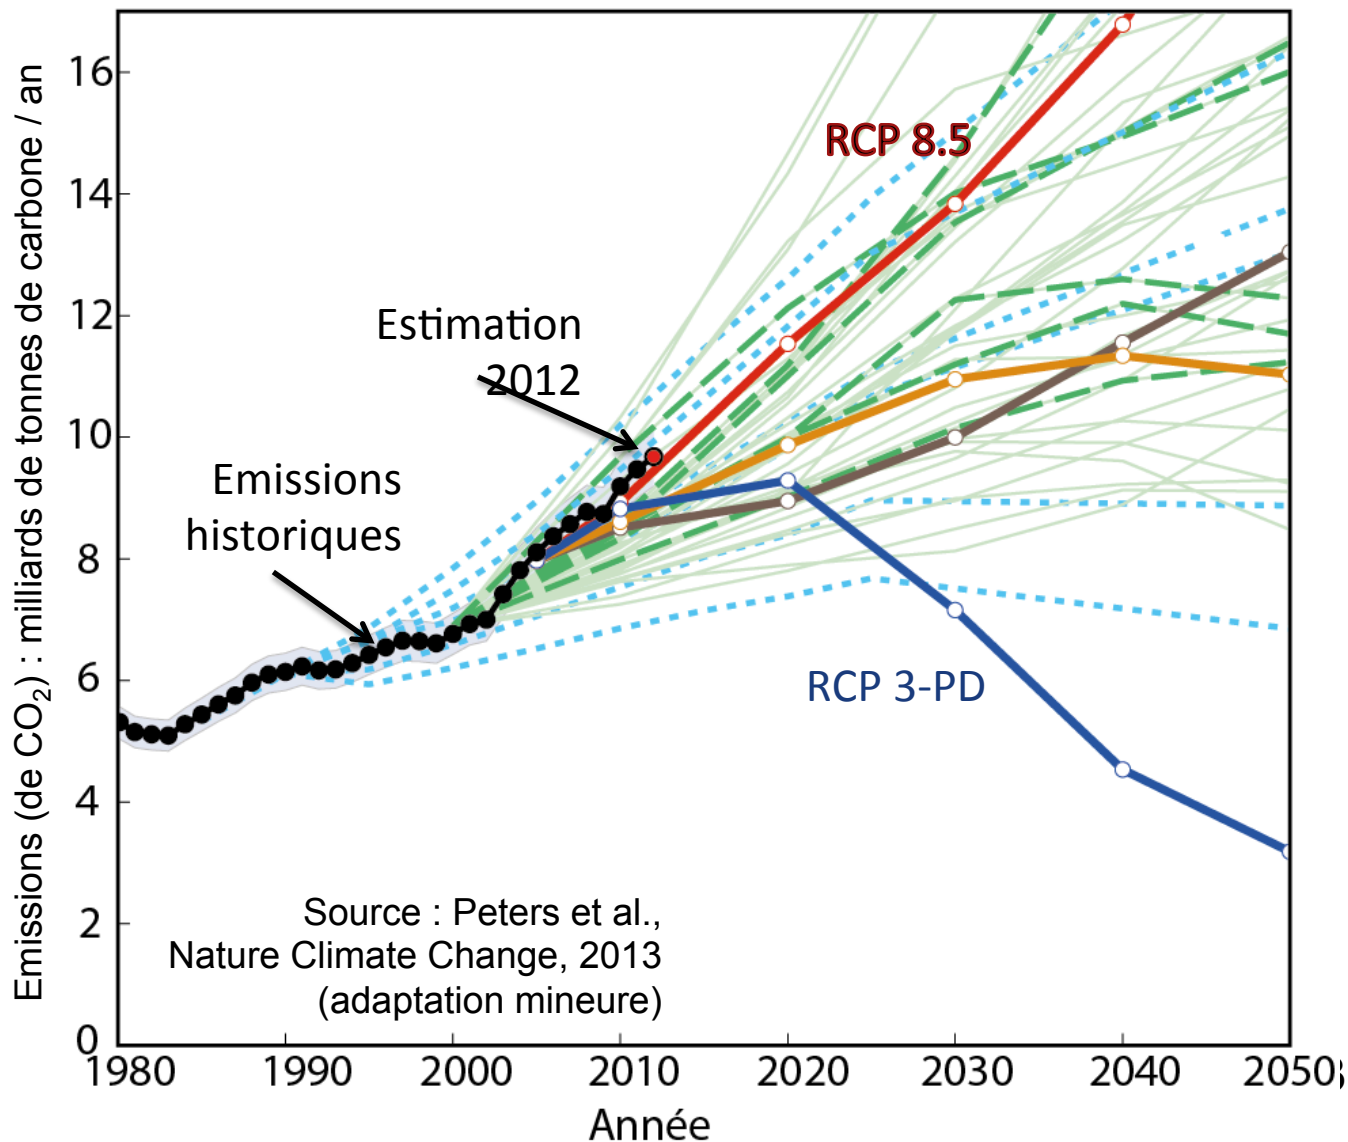

Multigas and CO₂ only studies combined

AR4: Emission peaking & reductions, concentrations, temperature, & sea-level rise due to thermal expansion

Category	CO ₂ concentration at stabilisation (2005 = 379 ppm) ^b	CO ₂ -equivalent concentration at stabilisation including GHGs and aerosols (2005=375 ppm) ^b	Peaking year for CO ₂ emissions ^{a,c}	Change in global CO ₂ emissions in 2050 (percent of 2000 emissions) ^{a,c}	Global average temperature increase above pre-industrial at equilibrium, using 'best estimate' climate sensitivity ^{d,e}	Global average sea level rise above pre-industrial at equilibrium from thermal expansion only ^f
	ppm	ppm	year	percent	°C	metres
I	350 – 400	445 – 490	2000 – 2015	-85 to -50	2.0 – 2.4	0.4 – 1.4
II	400 – 440	490 – 535	2000 – 2020	-60 to -30	2.4 – 2.8	0.5 – 1.7
III	440 – 485	535 – 590	2010 – 2030	-30 to +5	2.8 – 3.2	0.6 – 1.9
IV	485 – 570	590 – 710	2020 – 2060	+10 to +60	3.2 – 4.0	0.6 – 2.4
V	570 – 660	710 – 855	2050 – 2080	+25 to +85	4.0 – 4.9	0.8 – 2.9
VI	660 – 790	855 – 1130	2060 – 2090	+90 to +140	4.9 – 6.1	1.0 – 3.7

Les émissions récentes sont dans le haut
de la gamme considérée par les scientifiques

IPCC Decision (Mauritius, April 2006)

- IPCC expressed in 2005 the **need for new emission scenarios**, to be available well before completion of a possible AR5.
- The Panel recognized that the **development of scenarios for AR5 would be undertaken by the scientific community**.
- The **IPCC may catalyze such work** so as to promote its readiness in time for the AR5 cycle.

IPCC Decision (Bangkok, May 2007)

- Recalls its **support for decoupling** the climate modeling work from the emission scenario development work, in order to allow climate modelers a quick start.
- IPCC now requests the Steering Committee on New Scenarios to **prepare a few benchmark concentration scenarios** through the IPCC Expert Meeting in Noordwijkerhout (NL)
- These benchmark concentration **scenarios should be compatible with the full range** of stabilization, mitigation and baseline emission scenarios available **in the current scientific literature.**

TOWARDS NEW SCENARIOS FOR ANALYSIS OF EMISSIONS, CLIMATE CHANGE, IMPACTS, AND RESPONSE STRATEGIES

TECHNICAL SUMMARY

IPCC EXPERT MEETING REPORT

19–21 September, 2007

Noordwijkerhout, The Netherlands

Intergovernmental Panel on Climate Change

IPCC Expert Meeting Report,
Noordwijkerhout, 2008

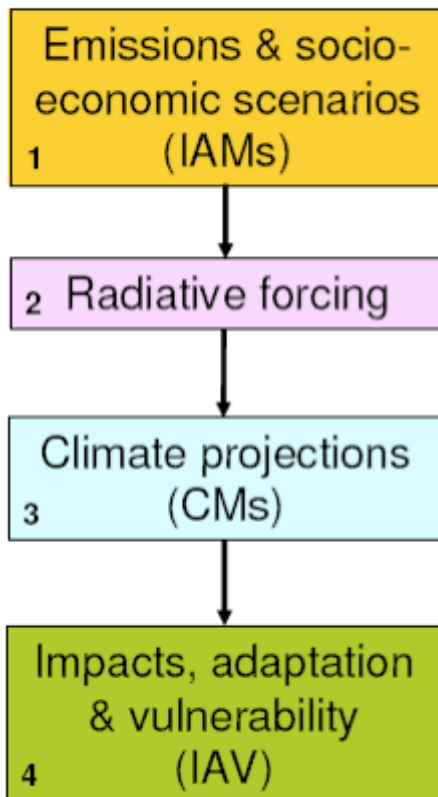

ipcc
INTERGOVERNMENTAL PANEL ON climate change

RCPs : «Representative Concentration Pathways» & «Parallel process» : accelerating the process -> projections

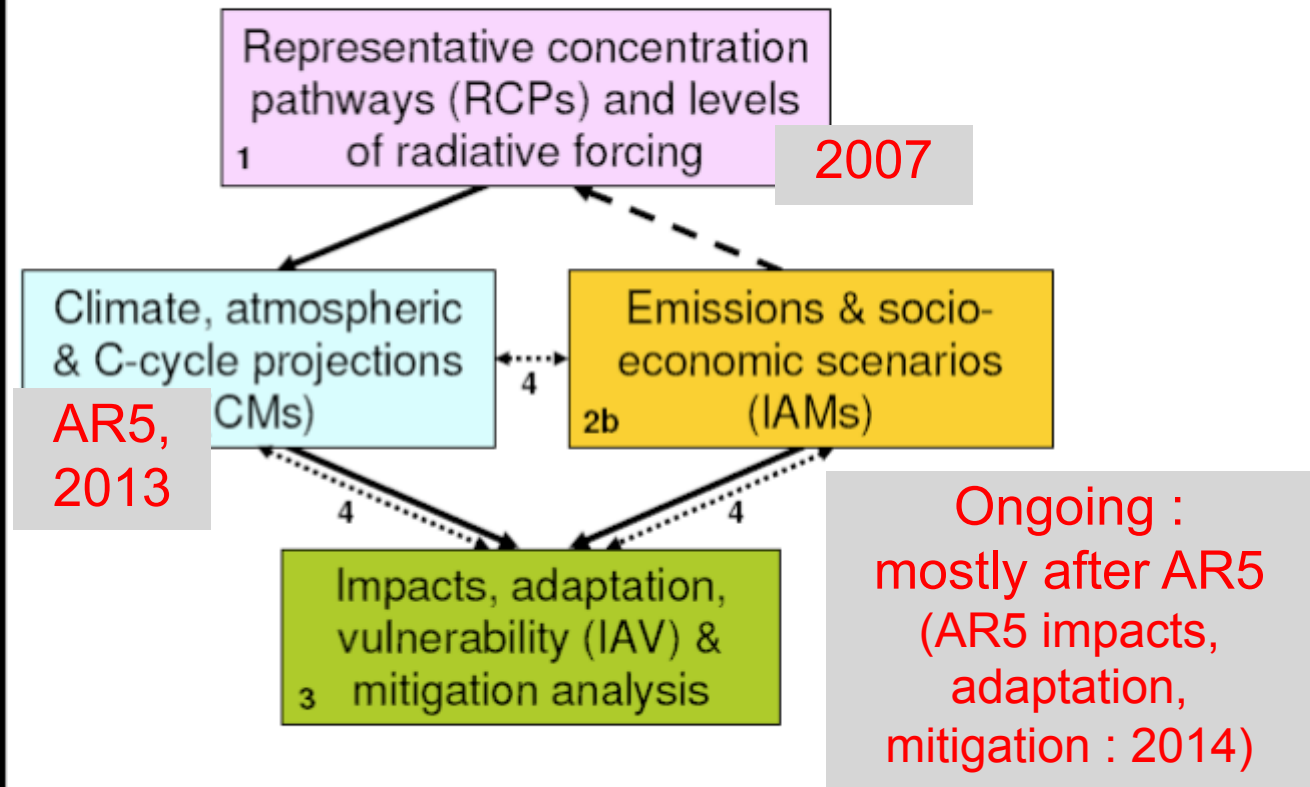

SRES > AR4

(a) Sequential approach

AR5

(b) Parallel approach

Source : IPCC expert meeting report, «Towards new scenarios...», 2008

Representative Concentration Pathways (RCPs)

- **RCPs were selected from literature (in 2007, hence not new / AR4 re emissions)**
- **Criteria:**
 - **compatibility with the full range of scenarios in the scientific literature (with & without mitigation and stabilization)**
 - **even number of scenarios : avoid suggesting a «best estimate»**
 - **availability of data for all relevant forcing agents and land use**
 - **sufficiently different so the climate model simulations can be distinguished**

Representative concentration pathways

All selected from existing literature (slightly updated)

Wide range of possible futures, including mitigation

**RCP8.5: 8.5 W/m² in 2100,
continue to increase**

**RCP6 : 6 W/m²,
then stabilisation**

**RCP4.5 : 4.5 W/m² in 2100,
then stabilisation**

**RCP3-PD : peak in radiative forcing
~3 W/m², then decline**

Decision : use RCP 2.6

Source : IPCC expert meeting report,
«Towards new scenarios...», 2008

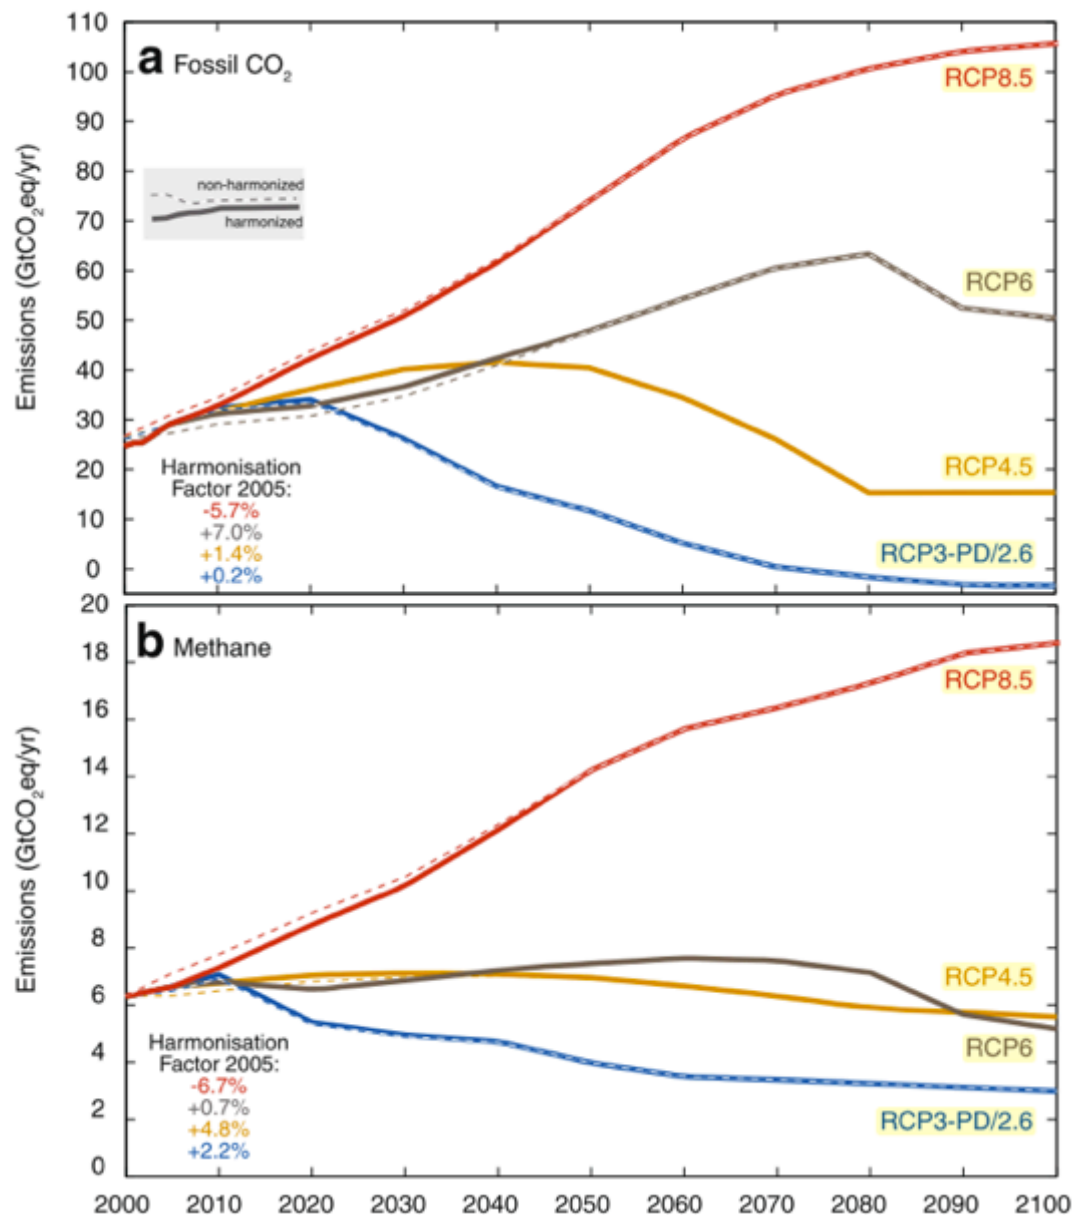

RCPs : extension beyond 2100

- > 2100 : schematic extension, no socio-economic background, important for climate projections -> long term changes

Source: Meinshausen et al.,
Climatic Change, 2011

RCPs : Emission pathways

All data for emissions & concentrations publicly available

UNEP

From Kathy Hibbard

Socio-economic aspects : SSPs

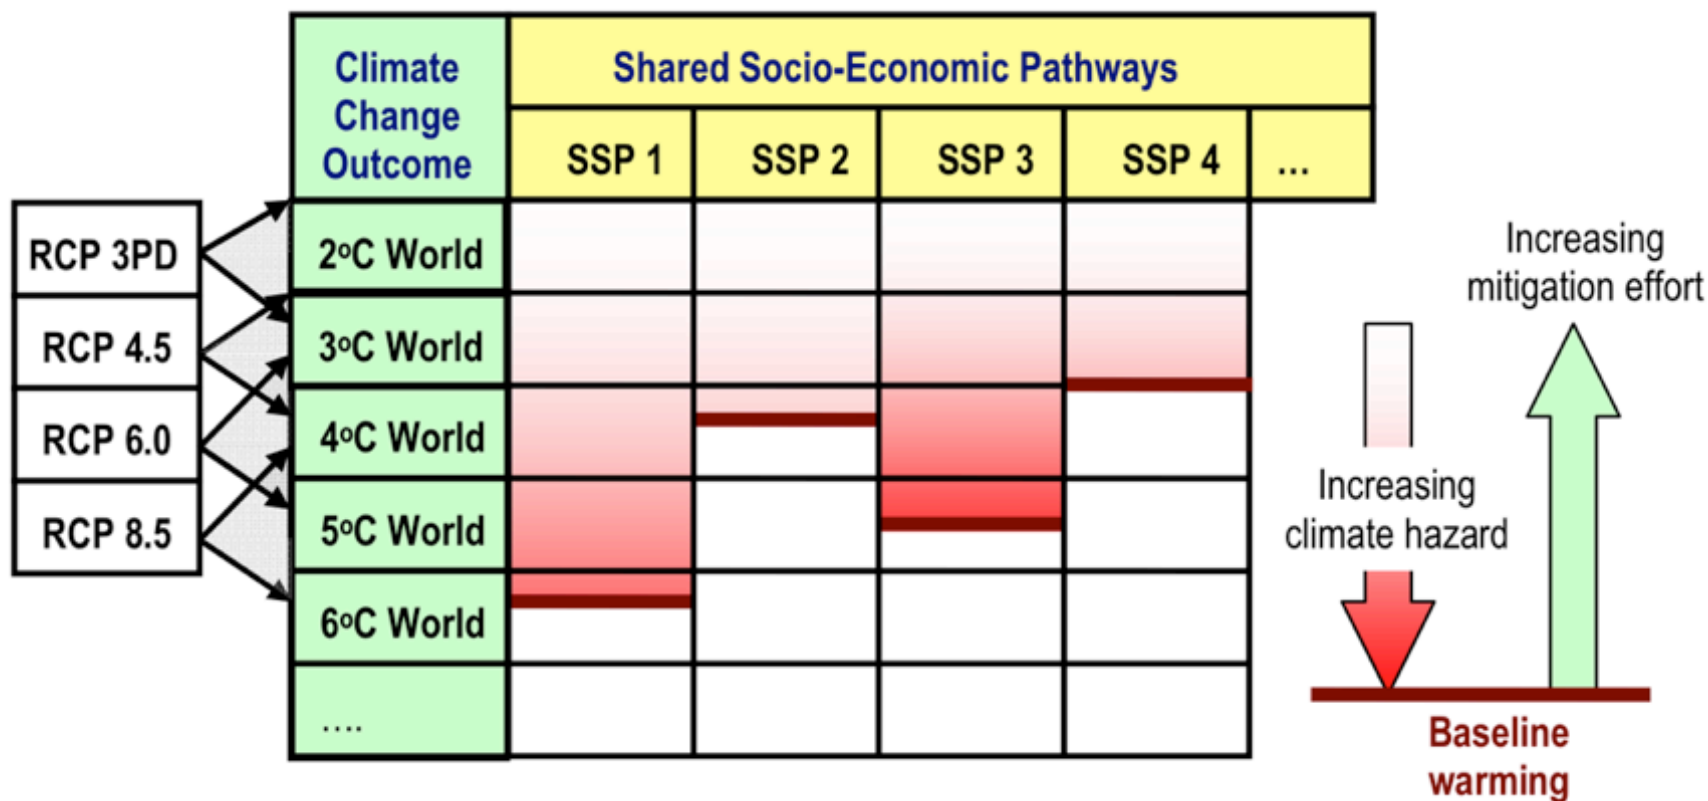

«Inverse approach», compared to SRES : starting from climate
«challenges»

From O' Neill et al., Climatic Change, October 2013

Socio-economic aspects : SSP and SPA

«Shared climate Policy Assumptions» (SPA),
to supplement the non-climate policy SSPs.
Combination of SSP + SPA links to a RCP

From Kriegler et al., Glob. Env. Change, 2012

What the RCPs (Representative Concentration Pathways) are:

- **Consistent sets of projections** of only the components of radiative forcing that are meant **to serve as input for climate modelling**, pattern scaling, and atmospheric chemistry modelling.
- **Named according** to their 2100 **radiative forcing level** (based on the forcing of greenhouse gases and other forcing agents).
- Chosen for scientific purposes to represent the **span of the radiative forcing literature at the time** of their selection and thus facilitate the mapping of a broad climate space.

What the RCPs (Representative Concentration Pathways) are:

- They **jump-start the scenario development** across research communities from which uncertainties about socioeconomic, climate, and impact futures can be explored.
- They constitute **just the beginning of the parallel process of developing new scenarios** for the IPCC's fifth Assessment Report.
- The RCPs aim at providing a **consistent analytical thread across scientific communities**.

What the RCPs (Representative Concentration Pathways) are NOT:

- The RCPs are not new, fully integrated scenarios (i.e., they are **not a complete package of socioeconomic, emissions, and climate projections**).
- The radiative forcing estimates on which they are based do not include direct impacts of land use (albedo) or the forcing of mineral dust.
- The RCPs are **not forecasts or boundaries for potential emissions, land-use, or climate change**.
- They are **not policy prescriptive** in that they **do not represent specific futures with respect to climate policy** action (or no action) or technological, economic, or political viability of specific future pathways or climates.
